

# SimplEnergy Residential Energy Audit Services

November, 2020

Energy Bill Screening (recommended first step)..... No Charge

Simply complete and submit the information form at <https://simplenergy.us/ninja-forms/3sa8b>. A Building Analyst will review the information and offer an opinion as to whether your home can significantly benefit from retrofit steps to reduce energy use and cost. If so, next steps will be recommended.

Site Energy Survey ..... \$100

A Building Analyst will visit your home for a walk-through and inspection and prepare an inspection report with recommended retrofit steps. No testing will be performed. This cost can apply toward full audits listed below.

Energy Audit with Blower Door Test ..... \$250

The Site Energy Survey will be supplemented with a Blower Door test to measure your total house air leakage. During the test, the Building Analyst will walk through the home to identify specific leaks needing attention. This will provide quantitative information to support the retrofit recommendations. Appropriate for homes with ductless heating and cooling.

Energy Audit with Blower Door Test and Duct Tightness Verification ..... \$325

The Duct Tightness Verification step is added to determine how much of your home’s leakage is through the duct system and pinpoint where duct sealing is appropriate.

Energy Audit with Blower Door Test-in and Test-out ..... \$350

Same as “Energy Audit with Blower Door Test,” except a second blower door test (“test-out”) will be performed after retrofit steps are completed to verify the effectiveness of the retrofits.

Energy Audit with Blower Door Test and Duct Tightness Verification, Test-in and Test-out ..... \$425

Same as “Energy Audit with Blower Door Test and Duct Tightness Verification,” except a second blower door test (“test-out”) will be performed after retrofit steps are completed to verify the effectiveness of the retrofits.

Blower Door Test (stand-alone) ..... \$125

If you simply want to measure the air leakage in your house, the test can be performed as a stand-alone activity. Note that a brief inspection is required before this test to assure that the conditions are appropriate for the test. No additional leakage diagnostics will be performed during the test.

Blower Door Test and Duct Tightness Verification (stand-alone) ..... \$200

Similar to above, the blower door and duct tightness verification can be performed without a full audit. A brief inspection is required to assure conditions are appropriate for the tests. No additional diagnostics performed.

Infrared Diagnostics ..... \$125

During a blower door test, the Building Analyst will photograph the house envelope from the inside using an infrared camera. This will help pinpoint areas that need to be air-sealed.

**CERTIFIED PROFESSIONAL**

Custom diagnostics can be performed on a case-by-case basis. The prices above are applicable for homes under 2400 square feet. For custom services or larger homes, call or email SimplEnergy for a quote. All work performed by a BPI Certified Professional.
